

Embedded Fields Overview

Last Modified on 07/06/2022 10:40 am PDT

Embedded Fields is a method for adding payment fields to your website or application. You can use Payment fields to collect credit card or ACH payment information. Payment fields may include account and routing number for ACH and account number, expiration date, and CVV for credit card payments.

Implementing Embedded Fields requires software development. However, you may be using an application with pre-built integration with Embedded Fields.

You can [customize](#) Embedded Fields to meet your security needs. Suppose you aren't already using a captcha service on your checkout page. In that case, we recommend that you enable [Google V3 Recaptcha](#) as part of Embedded Fields.

Refer to the Developer Portal to view the instructions for implementing Embedded Fields.
